PREDICTING CUSTOMER CHURN IN PYTHON

Senior Data Scientist, Alliance Data

Model assumptions

- Some assumptions that models make:
 - That the features are normally distributed
 - That the features are on the same scale

Data types

- Machine learning algorithms require numeric data types
 - Need to encode categorical variables as numeric

Encoding binary features

```
Option 1: .replace()
```

```
telco['Intl_Plan'].replace({'no':0 , 'yes':1})
telco['Intl_Plan'].head()

Option 2: LabelEncoder()

```
from sklearn.preprocessing importLabelEncoder

LabelEncoder().fit_transform(telco["Intl_Plan"])

telco['Intl_Plan'].head()
```

```

Encoding state

telco['State'].head(4)

```
0 KS
1 OH
2 NJ
3 OH
Name: State, dtype: object
```

Could assign a number to each state

```
0 0
1 1
2 2
3 1
Name: State, dtype: int64
```

- Bad idea
- Would make your model less effective

Feature scaling

- Features should be on the same scale
- Rarely true of real-world data

Feature scaling

```

Standardization

- Centers the distribution around the mean
- Calculates the number of standard deviations away from the mean each point is

```
from sklearn.preprocessing import StandardScaler
```

```
df = StandardScaler().fit_transform(df)
```

Let's practice!

Dropping unnecessary features

- Unique identifiers
 - Phone numbers
 - Social security numbers
 - Account numbers
- .drop() method

```
telco.drop(['Soc_Sec', 'Tax_ID'], axis=1)
```

Dropping correlated features

- Highly correlated features can be dropped
- They provide no additional information to the model

Feature engineering

- Creating new features to help improve model performance
- Should consult with business and subject matter experts

Examples of feature engineering

- Total Minutes: Sum of Day_Mins , Eve_Mins , Night_Mins , Intl_Mins
- Ratio between Minutes and Charge

```
telco['Day_Cost'] = telco['Day_Mins'] / telco['Day_Charge']
```

Let's practice!
